

1. The Accuracy are 0.7612, 0.906, 0.922, 0.928, 0.929, 0.936

As the training size increase, AUC increase.

2. The AUC are 0.639 0.629 0.699 0.679 0.645 0.623 0.622 0.622 0.622 0.622 0.622 0.500

The numbers of non-zero features are: 116, 106, 14, 5, 3, 2, 1, 1,
1, 1, 1, 0

The figures are

The AUC first increase then decrease. That is because at first the data dimension is too high. The model is overfitting. When the λ increase, overfitting is prevented. AUC increase. But when the λ is too high, too many weights are zero. Some useful feature are not used in the model. Hence AUC decrease. When there are no feature selected, all the prediction is positive. Hence the AUC is 0.5.
